Project II

Take your website from project 1, add to it:

1. Prompt the user, asking the user for their username.

    1. Write a function to validate whether or not the user input a name. If the user left it blank, re-prompt the user to enter their name.
    2. The username must then be rendered on the page as a welcome.
2. 5 Buttons that change the coloration / styling of the page. You must use the below methods to retrieve the elements, and then update their stylings (a good method of changing styling would be something of changing column sizes / colors / etc). Each styling set must be noticeably different:

    1. querySelector
    2. querySelectorAll
    3. getElementByID
    4. getElementsByClassName
    5. getElementsByTagName
